

## METHOD AND SYSTEM FOR ESTIMATING EXPORTATION TIME

5

### ABSTRACT

A method and system for estimating exportation time are proposed, for connecting a manufacturer through a network to a system for estimating exportation time, wherein the system estimates product exportation time for client orders received by the manufacturer according to practical operating conditions in product manufacture. In the use of the foregoing method and system, a first database stores uploaded and manufacture operating data from the manufacturer, so as to prompt the system to perform data operation and processing according to the stored data. Operation data results are stored in a second database, and used as reference to provide manufacture schedule data, order reply data, abnormal condition data and material insufficiency data to be downloaded by the manufacturer, so as to allow the manufacturer to execute product manufacture according to the downloaded data, and immediately realize problems in product manufacture to solve.
